

The 2-step wet wiping procedure

Systematic wiping.

Step 1

The blue bucket of the double rolling bucket system is filled with accurately dosed cleaning agent (e. g. terralin® protect). The red bucket is filled to one third with clear water. Later, the dirty water is collected in there. The squeezer is located above the red bucket.

Step 2

In the first step, the mop is soaked with the cleaning agent in the blue bucket.

Step 3

The surfaces are wiped with disinfectant by means of overlapping, loop-like/zigzag wiping movements. Adhering dirt is soaked and loosened. At intervals, the mop is rinsed in the red bucket and squeezed out into the same bucket.

Step 4

After the first steps, the mop is changed and the used mop is disposed of.

Step 5

Excess cleaning agent is absorbed by the second mop with the same wiping technique. The remaining wet film dries within a few minutes.

Step 6

The loosened dirt remaining is wiped up with the mop.

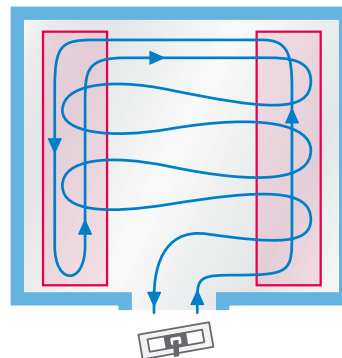

Step 7

The used mop and the dirty water are to be appropriately disposed of. The cleaning equipment must be cleaned after use.

Different approaches for narrow and wide surfaces
